## 1 Background introduction

With the rapid development of the Internet, people's dependence on Internet services is increasing day by day, and all walks of life are at a critical node in coping with digital transformation. Globally, it is becoming a trend to research and develop big data technology, use big data to promote economic development, improve social governance, and enhance government service and regulatory capabilities.

Traditional illegal and criminal activities are developing into Internet-related activities. New types of cyber terrorism, public opinion warfare, information warfare, and cognitive warfare are gradually entering the public eye, and the world pattern is quietly changing. Chinese enterprises have always grown up in international competition and have always adopted open and transparent market competition strategies. However, as China's international status continues to improve, the trend of "rising in the east and falling in the west" is obvious, and various unconventional means and forces have gradually emerged.

## 2 pain point analysis

### ■ Difficulty in obtaining effective information in a timely manner

The change brought about by the big data era is the explosive growth of data volume. Both users in the public security field and ordinary users need to face a practical problem, that is, how to obtain effective information in a timely manner. Whether it is changes in the international political situation, the introduction of economic policies, or the occurrence of regional disputes, they will have an impact on all levels of society. How to obtain effective information in a timely manner while blocking useless information has always been a difficult problem that has not been effectively solved.

### ■ Difficulty in obtaining information safely and effectively

The definition of intelligence is information that has practical significance and value. It is evaluated information with the purpose of helping decision makers and planners make correct decisions. The difficulty in intelligence work is how to further refine and conduct in-depth interpretation and mining from information in different scenarios. When an event occurs, the vast majority of users can make a basic understanding and intuitive judgment about the event. However, due to the lack of in-depth information such as the historical reasons behind the event and the interpretation of the relationships between the characters in the event, they usually rely heavily on a certain event. Participation of expert think tanks in specific fields. Therefore, how to effectively extract intelligence from information is also a difficult problem that needs to be solved urgently.

### ■ Difficulty in accessing cross-domain data information

In the economic activities of ordinary users, there is a large number of actual needs to conduct business transactions with other commercial companies, foreign institutions, and individuals. With the formation of the trend of various economic and criminal cases involving the Internet, there are a large number of problems in the market, such as: background checks, portraits, Risk rating needs. And public safety users have certain information

However, in the face of different scenarios and different fields, the traditional work method that relies on administrative orders becomes increasingly powerless, and there is an urgent need for solutions that can effectively connect information data in various fields.

### ■ Lack of suitable intelligence aids

Ordinary users usually seek external cooperation to solve specific intelligence needs, but decision makers need a tool that can dynamically understand information events, intelligence and situation evolution in a comprehensive way, while public security users mainly rely on their own personnel. When encountering various safety risks at work, technicians mainly rely on their own technical capabilities to solve them. In the process of intelligence-related technical work, there are various pain points that need to be solved urgently, including the security of data channels, management of combat missions, identity protection, etc. Once problems arise, accidents such as information leakage and data loss may occur.

## 3 Product positioning

The Xunzong Security Intelligence Platform is committed to building an integrated data and information solution platform that provides security, confidentiality, timely communication, and overall control, and provides comprehensive solutions to the four major pain points mentioned above. The currently launched version 1.0 is designed to provide customers with safe and effective intelligence.

At the network link layer, the product realizes the underlying security of data transmission through an anonymous link system built with intelligent hardware, and can provide secure Internet access that hides the real physical exit and IP address, which can solve the data transmission security problem that traditional SaaS platforms cannot obtain. The issue of effective guarantees.

Business application layer, platform version 1.0 provides intelligence material module and in-depth intelligence module. It is a working interface for our back-end think tank resources. The purpose of predictive research is to explain or illustrate a certain phenomenon. This

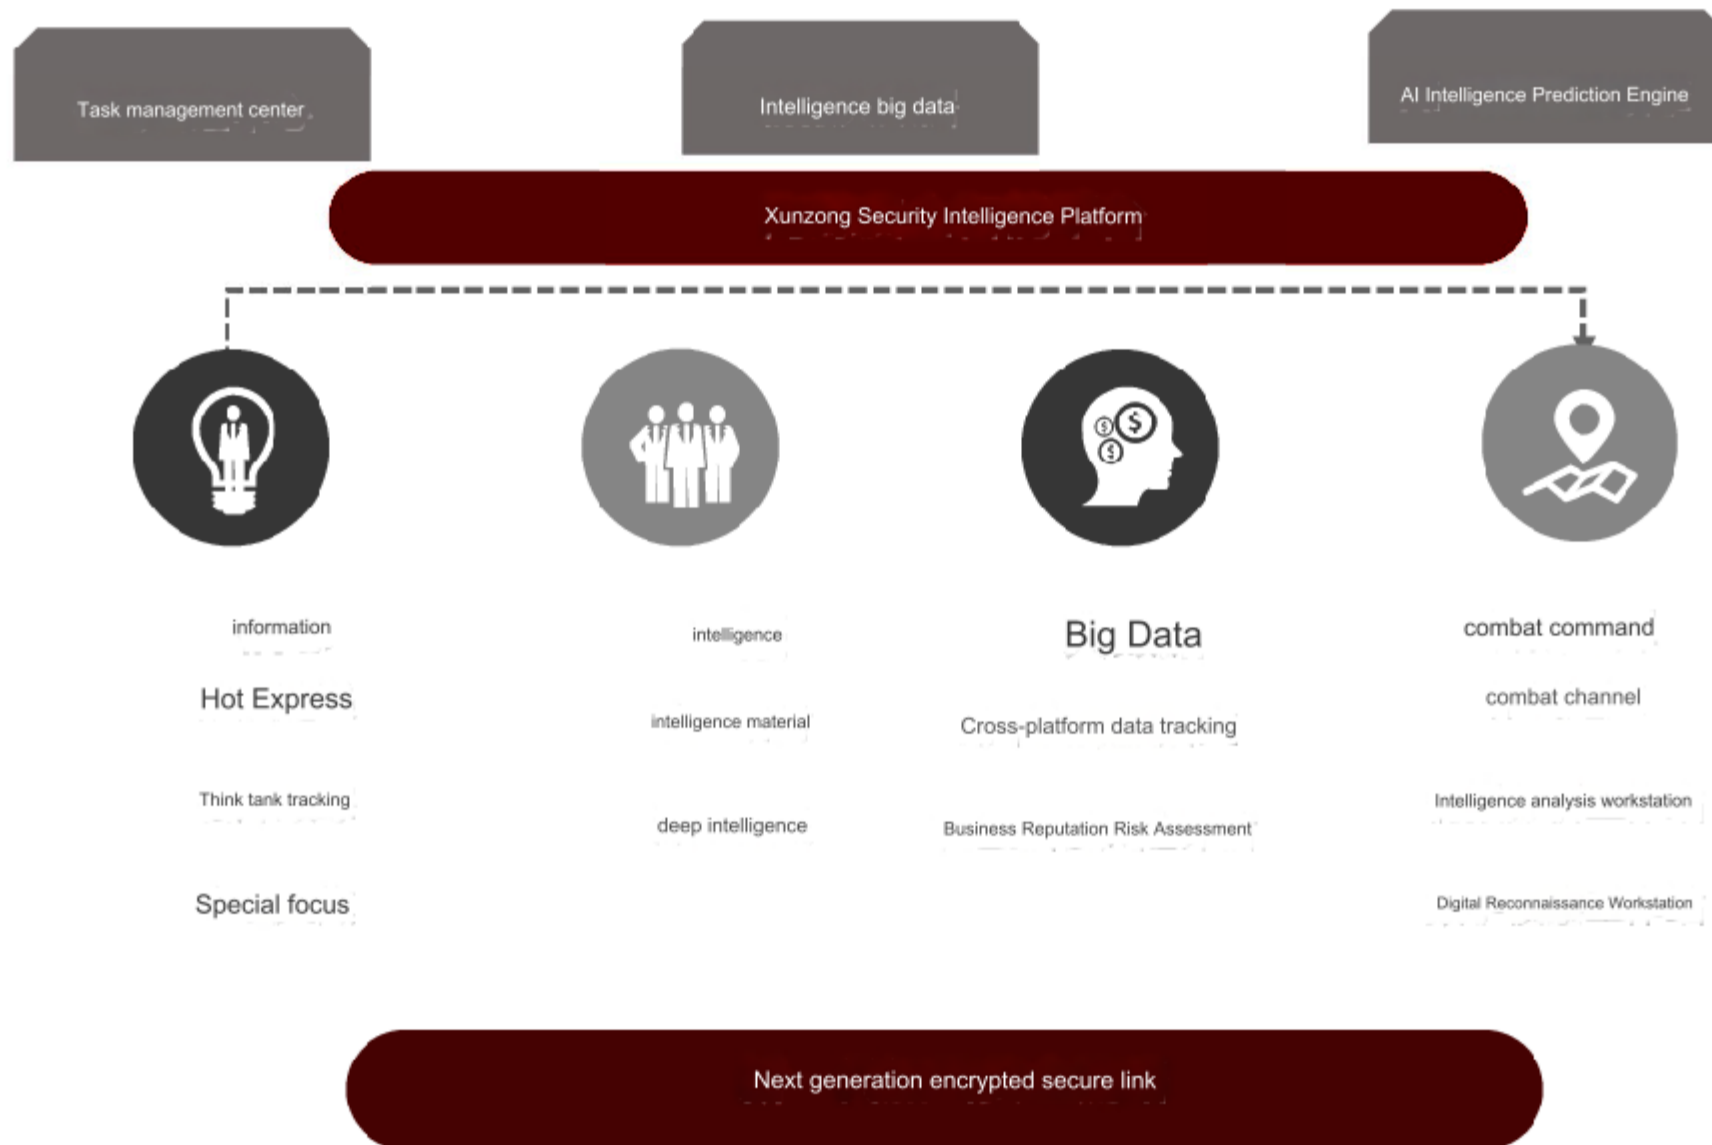

Extrapredictive research proposes new principles to predict the outcomes of interactions between certain variables. In this platform, what is mainly reflected is the irreplaceability of professional intelligence researchers. In addition to having professional qualities at the political, economic, social, cultural, military and other levels, their professional traits include reasoning ability, accuracy, and respect for facts. As well as humility, it also includes judgment, diligence, meticulousness, skepticism, detachment and imagination. Users can obtain in-depth research reports prepared by the back-end think tank team through the platform.

## 4 product goals

Xunzong Security Intelligence Platform covers the investigation, collection and analysis of topics and intelligence required by public security users. Relying on Anxun's massive data and case insights to gain new knowledge, it leads the research direction of digital economy and digital governance, and provides digital strategy design for public security customers. Accompanying the growth of customers through resource integration and analysis capabilities, the ultimate goal is to help customers take advantage of new technology scenarios and help customers break through the confusion of single points of information.

## 5 product architecture

The Xunzong security intelligence platform relies on encrypted secure links with independent intellectual property rights. On the premise of ensuring the safety and reliability of underlying communications, it provides real-time push, release, collection and feedback of important and sensitive data, reducing data loss during the interaction process. leakage risks and reduce the cost of communication time previously required.

## 6 product features

### 6.1 User-side functions

#### 6.1.1 User login

Users access services through secure link devices and log in to the application platform with assigned accounts and passwords.

#### 6.1.2 Intelligence materials

After logging in, users can view the list of intelligence materials belonging to their own departments or institutions according to their respective permissions. On this page, the data is arranged in reverse chronological order and the latest data is displayed at the front. Users can filter and search based on keywords or tags.

The data also provides secondary password protection, and users can decrypt it according to the corresponding password on the platform.

### 6.1.3 In-depth reporting

After logging in, users can view the in-depth intelligence list belonging to their own department or organization according to their respective permissions. On this page, the data is arranged in reverse chronological order and the latest data is displayed at the front. Users can filter and search based on keywords or tags.

The data also provides secondary password protection, and users can decrypt it according to the corresponding password on the platform.

### 6.1.4 User feedback

Users can safely send their opinions and needs to the platform administrator in a timely manner by commenting on a single piece of data or providing feedback on the entire column to complete timely interaction of opinions and suggestions.

## 6.2 Management side functions

### 6.2.1 Administrator login

Administrators log in to the application platform through secure link devices.

### 6.2.2 Upload intelligence resources

Administrators can publish, delete, enable and disable attachment resources on this page.

## 6.2.4 Respond to user feedback promptly

Administrators can provide timely feedback on users' suggestions and opinions through the user feedback system.

## 7 product advantages

### Secure link ensures data transmission security

Secure link is implemented through routing-like anonymous communication network hardware equipment. Through strong link encryption, multi-node jumps and random changes in exits, sensitive information such as the user's real IP address, physical address, interaction content and so on are hidden to achieve anonymous surfing. Functional products. The system can prevent sensitive information from being tracked and interactive content from being discovered, eliminating security risks.

### Modular platform content meets complex scenario applications

Currently launched version 1.0, intelligence material module and in-depth intelligence module. This module is a working interface for our back-end think tank resources. Users can subscribe to strategic intelligence produced by analysis teams in different professional fields in the think tank resources on demand according to their main work directions, including basic intelligence, dynamic intelligence, and character intelligence, economic intelligence, social intelligence, geographical intelligence, political intelligence and other related in-depth intelligence.

The combination of other module products can meet the various application needs of users in complex scenarios.

## Intelligence big data platform

The Tianji data query platform is currently a single big data query-platform that has been well received by users. It is designed to help users quickly find their targets. Users access the data cloud service in an encrypted manner and type the target's name, phone number or social media ID in the search box. The system can quickly and accurately locate the customer's target. At the same time, the system will display the target's detailed identity information after the database has been expanded. The target detailed identity information queried by the user can be divided into real identity information and network virtual identity information.

### Reconstructing the relationship between people in cyberspace

Through intelligence big data, we summarize global events involving military, political, economic, social and other aspects, track the development of events, and provide trends in situation evolution. Open up the security event character database, organization database, virtual character code deciphering database, etc.; combine face AI recognition technology to enhance video and image data in various environments, dynamically capture face recognition, identify corresponding key information, and conduct "Character Portraits" analysis. Through commercial company reputation ratings and character ratings, cyberspace character portraits are finally reconstructed to help users mine the relationships among target groups, correlate the relationships between characters in physical space, and determine the spatiotemporal positioning of characters.

### AI intelligence early warning mechanism

The world is currently on the verge of technological innovation. The coming all-digital era will change the pattern of global intelligence applications and subvert the situation of obtaining intelligence through traditional methods such as manpower. Through AI big data algorithms combined with in-depth intelligence analysis, strategic situation warnings and event warnings in related thematic fields are issued in the form of large decision-making screens. Provide users with basic intelligence, dynamic intelligence, predictive intelligence, character intelligence, economic intelligence, social intelligence, military intelligence, geographical intelligence, and political intelligence. Only by helping users adapt to the new technological era as quickly as possible can they remain invincible in the face of various complex environments such as business competition, great power competition, regional challengers, terrorism, and new cases.

### Comprehensive intelligence work assistance

Through dynamic construction of different modules in the SaaS platform, it can quickly adapt to different users to carry out intelligence work or meet intelligence needs in an all-round environment. For example, you can quickly understand events, situation changes, think tank reports, and policy interpretations in specific fields through smart mobile terminal devices. For example, in important time windows, on the basis of meeting network security, data security, and identity security, we can quickly seize the opportunity to carry out technical tasks, including information collection, format conversion, data query, dynamic creation of temporary data channels, and distribution work. Instructions, task management and control, etc.
